

BLUETooth Enabled Remote Java Media Player

There are loads of Media Players out in the world - freeware, shareware and commercial, and they all get the job done. So why, you may ask, write another one?

First, because there aren't many written in Java and we wanted to demonstrate what Java is capable of. Second, it was a good learning experience for us. Finally, because we wanted something to use that was a little less obtrusive than WinAmp or MusicMatch. Don't get us wrong those are both great products, but we wanted something that took up less screen real estate and memory.

Modules of the project:

- Interface for Audio Playback
- Interface for Video Playback
- Audio and Video Rendering
- Play list Management and ID3v tag editing
- Audio and Video Recording
- J2ME Module for Bluetooth Interface and Remote Controlling Using Mobile Device
